| Measurement Accuracy | 0.1 μm processing resolution for interpolated diameters. Absolute accuracy is beam profile dependent – ~1 μm accuracy is frequently achievable. |
| | Centroid accuracy is also beam dependent. It can be as good as ±1 μm since it is arithmetically derived from all pixels above the centroid clip level. |

Saturation Beam Power/ Pulse Energy Graphs

These two graphs allow you to simply determine the approximate maximum CW optical power (above) or pulse energy (below) that the standard WinCamD-UCM configuration can measure for your beam diameter and wavelength *without additional attenuation*. The **Saturation Limit** assumes:

- The provided ND 4.0 filter in place

- The electronic shutter set at 40 μs, its lowest value

- The ADC gain set at 1, its lowest value

- The beam onto the ND filter must not exceed 5 W total power or 100 mW/per mm². [10 W/per cm²]

The lower limit in the standard configuration is ~10^{-5} x the Saturation Limit.

WinCamD-Uxx Series Saturation Power Limits: 40 ms Exposure; ND4.0 filter; 85% of ADC.
For Lower limits, divide by 25,000. Higher & lower powers are possible with available accessories

WinCamD-Uxx Series *Saturation* Energy Limits: ND4.0 filter; 85% of ADC.
This graph is for a single pulse within the exposure period.
Higher & lower powers are possible with available accessories

Use the graph shown right to estimate for other wavelengths.
